Aircraft Dynamics

Flight dynamics is the science of air vehicle orientation and control in three dimensions. The three critical flight dynamics parameters are the angles of rotation in three dimensions about the vehicle's center of gravity (cg), known as pitch, roll and yaw. Control systems adjust the orientation of a vehicle about its cg. A control system includes control surfaces which, when deflected, generate a moment (or couple from ailerons) about the cg which rotates the aircraft in pitch, roll, and yaw.

The modern flight dynamicist requires a thorough understanding of the classical stability and control theory of aircraft, a working appreciation of flight control systems, and consequently, a grounding in the theory of automatic control. In this text, the author fulfils these requirements by developing the theory of stability and control of aircraft in a systems context. The key considerations are introduced using dimensional or normalised dimensional forms of the aircraft equations of motion. Through necessity, the scope of the text is limited to linearised small perturbation aircraft models. The material

Placing emphasis on dynamics and their importance to flying and handling qualities, it is accessible to both the aeronautical engineer and the control engineer.
